

Installation Guide Using Script

1. Clone the “deployment “ branch from the GitHub repo:

git clone -b deployment <https://github.com/Aishwary13/smp-portal.git>

```
● iiitd@smpvm:~/smp$ git clone -b deployment https://github.com/Aishwary13/smp-portal.git
Cloning into 'smp-portal'...
remote: Enumerating objects: 12944, done.
remote: Counting objects: 100% (2651/2651), done.
remote: Compressing objects: 100% (1162/1162), done.
remote: Total 12944 (delta 1485), reused 2170 (delta 1437), pack-reused 10293
Receiving objects: 100% (12944/12944), 19.62 MiB | 9.90 MiB/s, done.
Resolving deltas: 100% (4491/4491), done.
○ iiitd@smpvm:~/smp$
```

2. Extract the files and run the following commands:
 - a. cd smp-portal
 - b. chmod +x setup.sh
 - c. ./setup.sh
3. Here's an overview of the steps included in the setup script:
 1. Install Python and pip: This step updates the package list and installs Python 3.11.5 and pip.
 2. Install Nginx: Nginx is installed to serve as the web server.
 3. Install PostgreSQL: PostgreSQL is installed as the database management system.
 - a. Create PostgreSQL database and user: This involves accessing the PostgreSQL console and executing commands to create a database and user.
 4. Allow port 8000 through firewall: This step opens port 8000 to allow incoming connections.
 5. BackEnd:
 - a. Install virtualenv: Virtualenv is installed to create isolated Python environments.
 - b. Create and activate virtual environment: A virtual environment named "sdos" is created and activated.
 - c. Install Python dependencies: Required Python packages are installed using pip.
 - d. Move to the backend directory and start Django models: The script moves to the backend directory, where Django models are managed.
 - e. Migration commands are executed to apply database changes.

6. FrontEnd:

- a. Install Node.js: Node.js and npm are installed for frontend development.

Manual Installation Guide

Please follow each of the following steps exactly as mentioned.

1. Clone the “deployment “ branch from the GitHub repo:

```
git clone -b deployment https://github.com/Aishwary13/smp-portal.git
```

BackEnd:

1. Install Python and pip:
 - Update the package list: ``sudo apt-get update``
 - Install Python 3.11.5 and pip: ``sudo apt-get install -y python3=3.11.5 python3-pip``
2. Install Nginx:
 - Install Nginx: ``sudo apt install python3-pip python3-dev nginx``
3. Install PostgreSQL:
 - Install PostgreSQL: ``sudo apt-get install -y postgresql``
4. Create PostgreSQL database and user:
 - Access PostgreSQL console: ``sudo -u postgres psql``
 - Execute the following commands in the PostgreSQL console:
...
CREATE DATABASE smp;
CREATE USER admin WITH PASSWORD '12345';
ALTER ROLE admin SET client_encoding TO 'utf8';
ALTER ROLE admin SET timezone TO 'UTC';
GRANT ALL PRIVILEGES ON DATABASE smp TO admin;
...
5. Allow port 8000 through firewall:
 - Allow port 8000: ``sudo ufw allow 8000``
6. Install virtualenv:
 - Install virtualenv: ``pip3 install virtualenv``

7. Create and activate virtual environment:
 - Create virtual environment: ``python3 -m venv sdos``
 - Activate virtual environment: ``source sdos/bin/activate``

8. Install Python dependencies:
 - Install required Python packages:

```
pip3 install pytz typing-extensions sqlparse psycpg2 psutil asgiref Django==4.2.5  
django-rest-framework==3.14.0 django-cors-headers==4.3.0
```

9. Move to the backend directory and start Django models:
 - Move to backend directory: ``cd backend``
 - Run migrations:
 - ...
 - `python3 manage.py makemigrations`
 - `python3 manage.py migrate`
 - ...

FrontEnd:

1. Install Node.js:
 - Install Node.js and npm:

```
sudo apt install nodejs npm  
npm install
```
2. move to the directory `./smp` and run the command "npm start"

Hosting the Application

BackEnd:

1. After running the setup script first run the following command to start the venv

```
source sdos/bin/activate
```
2. After that check that gunicorn is successfully installed:

```
gunicorn --bind 0.0.0.0:8000 core.wsgi
```

```
(sdos) iiitd@smpvm:~/smp/smp-portal/backend$ gunicorn --bind 0.0.0.0:8081 core.wsgi  
[2024-04-26 14:48:55 +0000] [202779] [INFO] Starting gunicorn 22.0.0  
[2024-04-26 14:48:55 +0000] [202779] [INFO] Listening at: http://0.0.0.0:8081 (202779)  
[2024-04-26 14:48:55 +0000] [202779] [INFO] Using worker: sync  
[2024-04-26 14:48:55 +0000] [202780] [INFO] Booting worker with pid: 202780
```

3. Deactivate the virtual environment with :

deactivate

```
(sdos) iiitd@smpvm:~/smp/smp-portal/backend$ deactivate
```

4. Next create a system socket for gunicorn run:

sudo vim /etc/systemd/system/gunicorn.socket

5. And then paste the following content into the file:

```
[Unit]
```

```
Description=gunicorn socket
```

```
[Socket]
```

```
ListenStream=/run/gunicorn.sock
```

```
[Install]
```

```
WantedBy=sockets.target
```

press escape and type :wq to save the file

6. Next, we will create a service file for gunicorn:

sudo vim /etc/systemd/system/gunicorn.service

7. Paste the contents below inside this file:

```
[Unit]
```

```
Description=Gunicorn instance to serve core
```

```
Requires=gunicorn.socket
```

```
After=network.target
```

```
[Service]
```

```
User=iiitd
```

```
Group=iiitd
```

```
WorkingDirectory=/home/iiitd/smp-portal/backend
```

```
ExecStart=/home/iiitd/smp-portal/sdos/bin/gunicorn \
```

```
--access-logfile - \
```

```
--workers 3 \
```

```
--bind unix:/run/gunicorn.sock \
```

```
core.wsgi:application
```

```
Restart=always
```

```
RestartSec=3
```

```
[Install]
```

```
WantedBy=multi-user.target
```

press escape and type :wq to save the file

8. Lets now start and enable the gunicorn socket

```
sudo systemctl start gunicorn.socket
sudo systemctl enable gunicorn.socket
```

9. Check that the gunicorn is running:

```
sudo systemctl status gunicorn
```

```
• iiitd@smpvm:~/smp-portal/backend$ sudo systemctl status gunicorn
• gunicorn.service - Gunicorn instance to serve core
   Loaded: loaded (/etc/systemd/system/gunicorn.service; disabled; vendor preset: enabled)
   Active: active (running) since Tue 2024-04-30 14:49:11 UTC; 88ms ago
     TriggeredBy: • gunicorn.socket
   Main PID: 286067 (gunicorn)
      Tasks: 1 (limit: 4557)
     Memory: 11.1M
        CPU: 79ms
    CGroup: /system.slice/gunicorn.service
            └─286067 /home/iiitd/smp-portal/sdos/bin/python3 /home/iiitd/smp-portal/sdos/bin/gunicorn --access-logfile - --workers 3 --bind unix:/run/gunicorn.sock core.wsgi:application

Apr 30 14:49:11 smpvm systemd[1]: Started Gunicorn instance to serve core.
```

Nginx:

10. Configure Nginx: Create a new configuration file for the React app in Nginx's sites-available directory:

```
sudo nano /etc/nginx/sites-available/smpportal.iiitd.edu.in
```

11. Inside this file, configure Nginx to serve the React app:

Create a configuration file for Nginx using the following command:

```
sudo vim /etc/nginx/sites-available/smpportal.iiitd.edu.in
```

12. Paste the below contents inside the file created

```
server {
    listen 80;
    server_name smpportal.iiitd.edu.in;

    location /api/ {
        include proxy_params;
        proxy_pass http://unix:/run/gunicorn.sock;
    }
    location / {
        root /home/iiitd/smp-portal/build;
        index index.html;
        try_files $uri $uri/ /index.html;
    }
}

server {
    listen 443 ssl;
    listen [::]:443 ssl;
```

```

server_name smpportal.iiitd.edu.in;

ssl_certificate /etc/letsencrypt/live/smpportal.iiitd.edu.in/fullchain.pem;
ssl_certificate_key /etc/letsencrypt/live/smpportal.iiitd.edu.in/privkey.pem;

location /api/{
    include proxy_params;
    proxy_pass http://unix:/run/gunicorn.sock;
}
location /{
    root /home/iiitd/smp-portal/build;
    index index.html;
    try_files $uri $uri/ /index.html;
}
}

```

13. Enable Nginx Configuration: Create a symbolic link to enable Nginx configuration file in the sites-enabled directory:

```

sudo ln -s /etc/nginx/sites-available/smpportal.iiitd.edu.in
/etc/nginx/sites-enabled/

```

14. Restart Nginx: restart Nginx to apply the changes:

```

sudo systemctl daemon-reload

sudo service gunicorn restart

sudo service nginx restart

sudo systemctl restart nginx

```

To check logs in gunicorn :

```
journalctl -u gunicorn
```

To check logs in nginx:

```
sudo tail -f /var/log/nginx/access.log
```

```
sudo tail -f /var/log/nginx/error.log
```

Check Gunicorn Service Status:

```
sudo systemctl status gunicorn
```

Check Gunicorn is accepting requests:

```
curl --unix-socket /run/gunicorn.sock localhost
```

Check Nginx Service Status:

```
sudo systemctl status nginx
```

Changes for the VM/Deployment

1. Build the react application using: `npm run build`
2. and Merge the changes in the branch named “deployment”, {there will be some conflicts as running for testing requires the endpoints to be local host where as for deployment purposes we require the remote IP: change them to respective urls}.

Go to the VM machine and pull all the changes and run the following commands:

FrontEnd:

If there are any changes in the frontend, Run the following commands:

- 1) `npm run build`
- 3) `sudo systemctl restart nginx`

BackEnd:

If there are any changes in the backend, Run the following commands:

- 1) `sudo service gunicorn restart`
- 2) `sudo service nginx restart`
